

Acra Plant

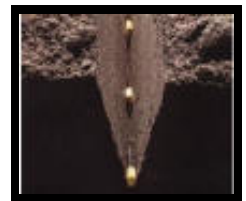

Acra Plant by Shield Ag

These are products that we have added to our line.

- Strong disc design is 50% thicker chrome-moly alloy that sheds wet soil better and keeps discs clear.
- Stronger, heavy duty bearing and flange design. Modified gothic arch bearing structure extends wear and runs straight and true.
- Molded rubber hubcap stays in place.
- Shield Acra Plant's retrofit notched discs and inserts turn your present planter into the ultimate narrow profile no-till system insert.
- 11 & 15 notch discs aggressively slice through the toughest residue.
- Retrofit package requires the Shield ACRA PLANT V-slice insert.

- Shield ACRA PLANT insert creates a uniform V-Slice below the sidewall compaction of discs. The formed V-Shape contacts seed firmly on both sides...soil springs back...catching and squeezes seed...locking it in place within the row as metered.
- Enhances the planting performance of your planter. The V-Slice creates a uniform firm & moist seedbed. It allows even spacing and uniform depth of each seed in the row.
- Faster and more even germination of seed. Faster and more uniform emergence of plants. Even competition between plants in row. Increased yield potential from each plant and better overall yields.

V-Slice Inserts for Planters

Available for Kinze, John Deere, and White planters.
