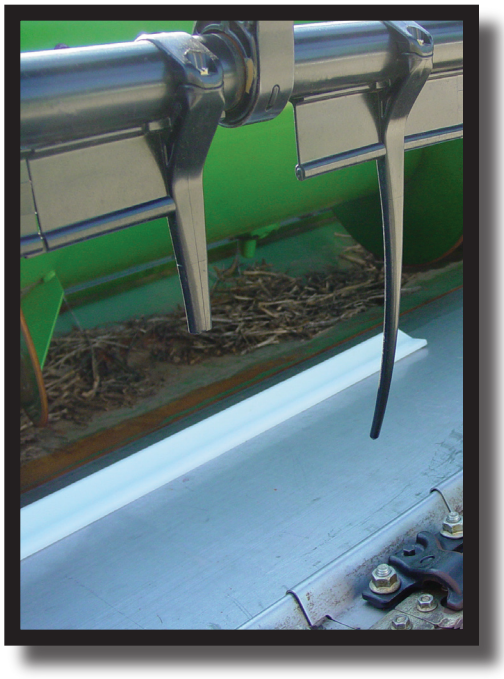
CFC Distributors, Inc.

Rock Guard & Dirt Guard

We began producing these units over six years ago and installing them on combines in a very local market. The biggest complaint we heard from combine operators, about other rock guards on the market, was that they would not allow short beans onto the platform.

Soybeans that normally would be cut and lay on the platform or fall off of the front of the combine are held in place by the rock guard fins until the platform is raised at the end of the field and the beans make it into the feeder house.

Because we suggest installing our rock guards BEHIND the sickle bar, the old problem of not being able to harvest short soybeans is eliminated while at the same time, keeping rocks out of the combine.



We produce our rock guards out of UV light stabilized UHMW poly angle. We stagger the rock guard fins to allow a smooth flow of crop into the combine while, at the same time, keeping rocks out of the combine. We have witnessed rocks the size of a child's head make it onto the platform and be held in front of the rock guard fin until the combine could be stopped and the rock removed from the platform.

List price is **$8.00** per foot.
